conaito VideoMail SDK - Easy and powerful Video recording in your webapplication's.

This document explains the PHP admin demo of the conaito VideoMail SDK. All settings are stored in a MySQL database. This sample admin demonstrate how you can use as example the conaito VideoMail SDK to build your own Video recording service.

Installation

- Easy to install and maintain - It's a quite familiar statement you can find in most of software download page, but with no database to install, this script is as easy as uploading and getting started!
- Supports Red5, FMS and Wowza server.
- Offers easy integration with PHP websites (ASP and ASP.NET samples coming very soon!).
- The site can be completely customized to your taste, using the PHP/XML files.
- Easy to edit the upload location and maximum record length of the videos, through xml files.

Admin Console

- Admin can control the video quality, video Size, video capturing time and other video settings via admin interface.
- Admin can modify the alert messages displayed while the system is connecting with the server, system disconnected from the server, when the web cam is not found and video recorded successfully, to provide unique and special alert messages for the members.
- Theme setting feature lets the admin to develop a custom look and feel for the recorder.
- Admin can manage all the recorded videos, download them to the local system and delete the videos on requirements.

Requirements for the PHP admin demo:

- Linux or Windows Server

- MySQL Database
- PHP support

Login

Before you have access to the admin you must be logged in.

rtmp_path
Rtmp Streaming Server Application Path.

uploadpath
A Js Function name or Web development language path which in turn relocate the recorded video into the server for further process like FLV encoding.

deletepath
A JS Function or Web Development language file path which in turn used to delete the recorded video from the server/ftp.

jscall
A boolean value which makes the recorder to identify whether it should call the JS or any other web development language file path for upload and deletion of recorded videos. It should be true if the JS functions are enabled and it should be false if the JS is disabled.

quality
An integer that specifies the required level of picture quality, as determined by the amount of compression being applied to each video frame. Acceptable values range from 1 (lowest quality, maximum compression) to 100 (highest quality, no compression).

seconds
Duration of the video to be recorded in seconds. Minimum recording Should be 3 seconds.

Themes

Here you can set the color theme for the Video Recorder.
